Chapter 3  
Radioactivity

Table of Contents

Introduction

1. Radioactivity
2. Types of Radioactive Decays
3. Natural Radioactivity
4. Artificial Radioactivity
5. The Rate of Radioactive Decay
6. The Effects of Radiation on Living Organisms
Chapter 3  Radioactivity

**Warm up**

- What is atomic bomb? How powerful is it?

- What is X-Ray? How is it used? Is there any danger of it?

- Do you have any idea about how the age of a fossil is calculated?
Introduction

• In 1896 Henri Becquerel discovered radiation emitted by uranium.
• Soon after Becquerel, Marie Curie completed much pioneering work on nuclear changes.

A Comparison of Nuclear and Ordinary Chemical Reactions

1. Both types of reactions require activation energy.
2. Total energy is conserved in both reactions.
3. In nuclear reactions nucleus changes.
4. In nuclear reactions number and types of atoms change.
A *Comparison of Nuclear and Ordinary Chemical Reactions*

5. Total mass is not conserved in nuclear reactions.

6. The factors like temperature, pressure affecting rates of ordinary reactions do not affect the nuclear reactions.

7. The amount of energy released in nuclear reactions is tremendously higher than that of ordinary chemical reactions.
1. Radioactivity

- The spontaneous emission of radioactive rays by an unstable nucleus is called radioactivity.

- Spontaneously disintegrating atoms are called radioactive atoms. Most radioactive atoms have the following properties:
  - $N_n/N_p > 1.5$
  - The atomic number is bigger than 83.
Chapter 3

1. Radioactivity

- Neutrons
- Protons

Strong nuclear force (Acts on protons and neutrons alike)

Electric repulsion (Acts on protons)
Chapter 3

1. Radioactivity
Chapter 3

1. Radioactivity

Relative Stability of Nuclei

![Graph showing the relative stability of various nuclei](image)

- Binding energy per nucleon (kJ/mol) on the y-axis
- Mass number of nucleus on the x-axis
- Various isotopes, including $^4_2\text{He}$, $^6_3\text{Li}$, and $^{238}_{92}\text{U}$, plotted on the graph

The graph illustrates the relative stability of different nuclei as a function of their mass number and binding energy per nucleon.
Chapter 3

1. Radioactivity
Atomic number = Number of protons = 82
Mass number = Number of protons + Number of neutrons = 206
Number of neutrons = Mass number – Atomic number
Number of neutrons = 206 – 82 = 124

Neutron-to-proton ratio = \[ \frac{\text{Number of neutrons}}{\text{Number of protons}} \]
Neutron-to-proton ratio = \[ \frac{124}{82} \]
Neutron-to-proton ratio = \[ \frac{1.51}{1} \]
Chapter 3

1. Radioactivity

The Band of Stability

Each point on the graph represents a stable atom.

Number of neutrons vs. Number of protons graph with the following annotations:
- **^{107}_{47}Ag**: n/p ratio = 1.28
- **^{206}_{82}Pb**: n/p ratio = 1.51
- **^{4}_{2}He**: n/p ratio = 1.0

Band of stability indicated by the scatter of points.
## Chapter 3

There are mainly three types of emissions by radioactive atoms: alpha, beta and gamma.

These radiations have various effects:
1. They can ionize substances,
2. They can cause substances to phosphoresce and fluoresce,
3. They can effect photographic film.
4. They affect the living cells and cause them to suffer cancer.
5. Glass, porcelain and ceramics can be colored when they are exposed to radiation.
2. Types of Radioactive Decays

1. Alpha (α) Particles

- They are identical to the nuclei of helium atoms. (\( {}^4_2\text{He} \))
- Their speed is approximately 1/10 of the speed of light.
- Since they have 2+ charged particles they are shown as \( {}^4_2\text{He}^{2+} \)
- They are deflected by magnetic and electric fields.
- Its penetrating power is low it can be stopped by a paper.
- The nucleus of an atom undergoing an alpha decay loses \( \text{He}^{2+} \) particles and it emits two protons and two neutrons.

\[
\frac{238}{94}\text{U} \rightarrow \frac{234}{90}\text{Th} + \frac{4}{2}\text{He}
\]
Chapter 3

2. Types of Radioactive Decays

1. Alpha (α) Particles
Chapter 3

2. Types of Radioactive Decays

1. Alpha (α) Particles
Example 1
A radioactive $^{218}_{84}Po$ isotope emits one $\alpha$ particle and transmutes to the atom $X$. Find the atomic number, atomic mass number and the symbol of the atom $X$.

Solution

$^{218}_{84}Po \rightarrow ^{214}_{82}X + ^{4}_{2}He$

$^{214}_{82}X$ is Pb
2. Beta (β) Particles

- They are identical to electrons. ($\ _1^0 e$)
- Their speed is approximately the speed of light.
- They are negatively charged particles.
- Since they have 1- charged particles they are shown as $\ _{-1}^0 e$ or $\beta^-$
- They are deflected by magnetic and electric fields.
- Its penetrating power is stronger than alpha particles.
- An atom undergoing beta emission loses one neutron and gains one proton, therefore its atomic number increases by one and mass number remains unchanged.

$$\ _0^1 n \rightarrow \ _1^1 p + \beta^-$$
Chapter 3

2. Types of Radioactive Decays

2. Beta (β) Particles
2. Beta (β) Particles
Example 2

A radioactive $^{238}_{93}Np$ isotope emits one $\beta$ particle and transmutes to the atom $Pu$. Find the atomic number and atomic mass number $Pu$.

Solution

$^{238}_{93}Np \rightarrow ^{238}_{94}Pu + ^{0}_{-1}e$
3. Gamma (γ) Rays

- They are electromagnetic radiation with a very high energy. Generally they are produced after alpha and beta radiations as energy.
- They are electrically neutral particles.
- It has no mass and charge.
- Its penetrating power is one hundred times greater than that of beta rays.

\[
^{234}_{92}U \rightarrow ^{230}_{90}\text{Th}^* + \alpha
\]

\[
^ {230}_{90}\text{Th}^* \rightarrow ^ {230}_{90}\text{Th} + ^0_0\gamma
\]
Chapter 3

2. Types of Radioactive Decays
Chapter 3

2. Types of Radioactive Decays
2. Types of Radioactive Decays
Chapter 3

2. Types of Radioactive Decays

4. Positron Emission

• It is the transmutation of one proton into one neutron in the nucleus of atom. As a result a positively charged particle with a same mass as a beta particle is emitted.

• It is shown as \( ^{0}_{+1}e \) or \( \beta^+ \).

• As a result of positron emission the atomic number of an element decreases by one, whereas the atomic mass remains unchanged.

\[
\begin{align*}
{^{1}_{1}}p & \rightarrow {^{0}_{0}}n + {^{0}_{+1}}e \\
{^{23}_{12}}Mg & \rightarrow {^{23}_{11}}Na + {^{0}_{+1}}e \\
{^{30}_{15}}P & \rightarrow {^{30}_{14}}Th + {^{0}_{+1}}e
\end{align*}
\]
Chapter 3

2. Types of Radioactive Decays

4. Positron Emission

\[ ^{11}_{6}C \rightarrow ^{11}_{5}B + ^{0}_{1}b \]

\[ ^{11}_{6}C \rightarrow \text{Carbon-11} \rightarrow \text{Boron-11} \rightarrow \text{Positron} \]
Example 3

A radioactive $^{141}_{56}Ba$ isotope transmutes into Cs by decaying through one $\beta^+$ emission. Find the atomic number of Cs.

Solution

$^{141}_{56}Ba \rightarrow ^{141}_{55}Cs + ^0_{+1}e$
2. Types of Radioactive Decays

5. Electron Capture

• It has the same effect as positron emission. It happens when one electron from inner shell is captured by the nucleus. As a result one proton transmutes into one neutron.

• In electron capture atomic mass number remains unchanged and atomic number decreases by one.

\[ _{-1}^0 e + _1^1 p \rightarrow _0^1 n \]

\[ _{47}^{106} Ag + _{-1}^0 e \rightarrow _{46}^{106} Pd , \quad _{81}^{202} Tl + _{-1}^0 e \rightarrow _{80}^{202} Hg \]
Chapter 3

2. Types of Radioactive Decays

5. Electron Capture
Example 4

\[ ^{141}_{56}Ba + ^{0}_{-1}e \rightarrow X \]

Find the number of neutrons in X atom.

Solution

\[ ^{141}_{56}Ba + ^{0}_{-1}e \rightarrow ^{141}_{55}X \]

\[ n = 141 - 55 = 86 \]
2. Types of Radioactive Decays

6. Neutron Emission

• It occurs by removal of a neutron from a nucleus.
• Isotope of the original element is formed.
• Atomic number remains unchanged and atomic mass number decreases by one.

\[
\begin{align*}
^{106}_{47}Ag & \rightarrow ^{105}_{47}Ag + ^{1}_{0}n \\
^{87}_{36}Kr & \rightarrow ^{86}_{36}Ag + ^{1}_{0}n
\end{align*}
\]
Example 5

A radioactive nucleus $^{234}_{92}\text{U}$ transmutes into one of its isotope through three neutron emission. What is the neutron/proton ration in the new nucleus produced?

Solution

$^{234}_{92}\text{U} \rightarrow ^{231}_{92}\text{U} + 3^1_0\text{n}$

No. of neutrons = $231 - 92 = 139$

$$\frac{\text{neutron}}{\text{proton}} = \frac{139}{92} = 1.51$$

</table>
• Between 1852-1908 Henry Becquerel studied about radioactive substances. He discovered an uranium salt, uranyl sulfate, $\text{K}_2\text{UO}_2(\text{SO}_4).2\text{H}_2\text{O}$.

• In 1895 X-rays were discovered by Wilhelm Roentgen.

• Most of the studies about radioactivity have been done by Curie Family.

• They discovered many other radioactive elements, Polonium, Radium and Thorium. They got Nobel Prize, but died due to severe radioactive radiation of these elements.
Chapter 3

4. Artificial Radioactivity

• Some non-radioactive substances can undergo radioactive changes by bombarding them with various particles. This process is known as artificial radioactivity.

• The first non-radioactive element $^{17}_8 O$ was produced by Ernest Rutherford in 1919.

\[
\alpha + ^{14}_7 N \rightarrow ^{15}_8 O + ^1_1 H
\]

• In 1932 James Chadwick obtained free neutrons by bombarding $^{9}_4 Be$ atoms with alpha particles.

\[
\alpha + ^{9}_4 Be \rightarrow ^{12}_6 C + ^0_0 n
\]
Example 6

What is the particle X produced by the nuclear reaction below?

\[ ^7_3 \text{Li} + ^1_1 \text{p} \rightarrow ^7_4 \text{Be} + X \]

Solution

\[ ^7_3 \text{Li} + ^1_1 \text{p} \rightarrow ^7_4 \text{Be} + ^1_0 \text{n} \]
1. Nuclear Fission

- The disintegration of a heavier nucleus into lighter nuclei by neutron bombardment is called nuclear fission.

- In 1938, Otto Hahn and Fritz Strassman of German invented nuclear fission reaction.

\[ ^{235}_{92}U + ^{1}_{0}n \rightarrow ^{92}_{36}Kr + ^{141}_{56}Ba + 3^{1}_{0}n \]

- The continuous chain reaction results huge amount of energy. By using this property atomic bomb is prepared.

- The chain reaction was first achieved by Enrico Fermi in 1942 in Chicago.
2. Nuclear Fusion

- The combination of two or more lighter nuclei to form a heavier nucleus is called nuclear fusion.
- The amount of energy released by the fusion reaction is much more greater than that of fission reaction. But it needs huge amount of activation energy.
- Nuclear fusion is the basis of the hydrogen bomb.

\[
\begin{align*}
\frac{2}{1}H + \frac{3}{1}H & \rightarrow \frac{4}{2}He + \frac{1}{0}n + \text{energy} \\
\frac{2}{1}H + \frac{2}{1}H & \rightarrow \frac{4}{2}He + \text{energy}
\end{align*}
\]
Chapter 3

4. Artificial Radioactivity

\[
\begin{align*}
\frac{4}{2}\text{He} & + \frac{4}{2}\text{He} \rightarrow \frac{8}{4}\text{Be} + \gamma \\
\frac{4}{2}\text{He} & + \frac{8}{4}\text{Be} \rightarrow \frac{12}{6}\text{C} + \gamma
\end{align*}
\]
Chapter 3

4. Artificial Radioactivity
5. The Rate of Radioactive Decay

- The changing of radioactive elements into other elements through radioactive emissions is called either radioactive decay or radioactive disintegration.
- Geiger-Muller counter is used to detect the intensity of radiation.
- Rate of radioactive decay is the number of atoms emitting a radioactive ray per a unit time. The rate of decay is directly proportional to the initial amount of substance and the structure of nuclei. It is independent of physical and chemical properties.
The period of time required for half of the initial amount of the substance to disintegrate is called half-life. The shorter the half-life the higher the rate of radioactive decay.

\[ m = \frac{m_0}{2^n}, \quad n = \frac{t}{t_{1/2}} \]

- \( m \): mass remained
- \( m_0 \): initial mass
- \( n \): number of half-lives
- \( t \): time passed
- \( t_{1/2} \): half-life
Chapter 3

5. The Rate of Radioactive Decay

![Diagram showing the decay of Potassium-40 to Argon over time](image)
5. The Rate of Radioactive Decay
Chapter 3

5. The Rate of Radioactive Decay

Uranium-238 Decay Series

- Mass number vs. Atomic number
- Gamma rays are given in yellow
- Alpha decay is indicated by a dashed green line
- Beta decay is indicated by a solid red line
- Stable elements are indicated by black

Key:
- s = seconds
- m = minutes
- d = days
- y = years

Elements:
- 238 U
- 234 U
- 230 Th
- 226 Rn
- 222 Rn

Decay Series:
- 238 U → 234 U → 230 Th → 226 Rn → 222 Rn → ...
Example 7
How many grams of one mole of $^{214}$Bi will remain undecayed after 80 minutes if its half-life is 20 minutes?

Solution

\[ n = \frac{t}{t_{1/2}} \quad \Rightarrow \quad n = \frac{80}{20} = 4 \]

\[ m = \frac{m_0}{2^n} \quad \Rightarrow \quad m = \frac{214 \text{g}}{2^4} = 13.375 \text{g} \]
Example 8
The amount of a 40 g sample of $^{222}\text{Rn}$ remaining after 16 days is 2.5 g.

Solution

\[
m = \frac{m_0}{2^n} \Rightarrow 2.5 = \frac{40}{2^n} \Rightarrow 2^n = 16 = 2^4 \Rightarrow n = 4
\]

\[
4 = \frac{16}{t_{1/2}} \Rightarrow t_{1/2} = 4 \text{ days}
\]
6. The Effects of Radiation on Living Organisms

- There are many different types of uses of radiation such as TV, cellphones, photocopy machines, x-ray machines.
- Nuclear reactions; fission and fusion, also produce radiations although the reactions stop.
- The radiation produced by stars, sun and explosions in the space is called cosmic rays.
- These radiations are dangerous when at higher intensities. They damage the cells and cause carcinogenic tumors. The further damage is change in genetic structure or it is called mutation.
6. The Effects of Radiation on Living Organisms

- Although radiation has very harmful effects it has many applications in medicine, in household items, in food and petroleum industries as well as in archaeology.
